SUMMARY

Senior backend-focused engineer building reliable, maintainable, and observable services with Python, Go, microservices architecture, PostgreSQL, Redis, and asynchronous processing. Experienced owning backend domains end to end: requirements, API design, data modeling, implementation, deployment, debugging, and production iteration. Strong fit for Kiddom's backend platform work: scalable APIs and databases, distributed workflows, customer-aware troubleshooting, code quality, and product empathy for tools that support real users.

EXPERIENCE

Grey Cross Developments - Product Engineer

Jul 2022 - Present

- Own backend domains end to end across SMB products and consulting work, from architecture and implementation through deployment, production debugging, and iteration.
- Design and implement REST APIs for client-facing and internal services, emphasizing clear contracts, maintainable service boundaries, and versioning discipline.
- Build asynchronous and event-driven backend pipelines for real-time and batch workloads, improving responsiveness and reliability across production workflows.
- Implement data ingestion and processing systems over structured datasets, supporting consistent reporting, operational visibility, and downstream decision-making.
- Work across Python, Go-oriented backend architecture, PostgreSQL, Redis, Docker-based environments, and external service integrations.
- Integrate AI-powered features into production services where useful, focusing on grounded outputs, predictable behavior, and operational safety.
- Collaborate directly with non-technical stakeholders and clients, translating ambiguous product needs into maintainable backend systems and supportable workflows.

Vittahouse - Automation & Data Consultant

Oct 2019 - Nov 2025

- Automated accounting, audit, and operational workflows, reducing manual process steps and increasing consistency in recurring business operations.
- Built discrepancy-detection tooling across datasets to surface anomalies earlier and support auditability, reporting, and stakeholder decisions.
- Delivered data-driven reporting workflows that converted non-technical requirements into backend automation and maintainable data processes.
- Troubleshoot production data issues with business users, communicating tradeoffs clearly and driving fixes to completion with high ownership.

SELECTED PROJECTS

ForgeGraph - AI-powered company OS platform

Nov 2025 - Present | <https://github.com/MikeAthie/ForgeGraph>

- Built ForgeGraph as an AI-powered company operating system that analyzes competitor activity, social channels, and business context to turn unstructured signals into actionable strategy deliverables.
- Designed backend workflows for competitive strategy scraping, content analysis, report generation, approval gates, and durable company state.
- Developed backend services around clear ownership boundaries, provenance, policy gates, and scalable expansion across business-intelligence and agentic workflow use cases.
- Relevant to Kiddom: service architecture, data-heavy backend workflows, product-facing automation, grounded AI features, and systems designed for reliable downstream decisions.

Automated Trading Bot (Binance)

Aug 2025 - Present | <https://github.com/MikeAthie/2m2>

- Built a real-time asynchronous data ingestion pipeline consuming market data via WebSockets and persisting streams in Redis for low-latency access.
- Orchestrated background execution with Celery workers to process signals and place orders asynchronously with resilient task handling.
- Separated indicator computation into a dedicated Redis-backed service to isolate workloads and improve throughput, reliability, and maintainability.
- Relevant to Kiddom: distributed processing, real-time ingestion, Redis-backed services, background workers, and reliability-minded production design.

EDUCATION

ITAM - Instituto Tecnológico Autónomo de México

Bachelor of Science in Law | 2017

SKILLS

- Backend Engineering: Python, Go, microservices architecture, REST APIs, service boundaries, maintainable codebases, production ownership
- Data & Storage: PostgreSQL, schema design, performance-minded querying, Redis, Redis Streams, structured datasets, data ingestion
- Async & Distributed Systems: event-driven pipelines, WebSockets, Celery, background workers, resilient task handling, service isolation
- Cloud & DevOps: Docker-based development, deployment workflows, operational visibility, failure handling, performance tuning
- Product & Collaboration: code review mindset, TypeScript-aware API collaboration, startup ownership, customer-aware troubleshooting, clear written communication, remote ownership
- AI in Production: RAG and agent workflows, AI feature integration, grounding, provenance, safety checks, predictable outputs

CERTIFICATIONS

- Meta Back-End Developer Professional Certificate (May 2023)
- IBM RAG and Agentic AI Professional Certificate (May 2025)
- Cambridge English C2 Proficiency certificate
