TurnKey Tech Staffing / Kiddom Hiring Team

Dear Hiring Team,

I am excited to apply for the Senior Backend Engineer (Python/Go) role supporting Kiddom. The opportunity stands out because it combines the kind of backend engineering I enjoy most - scalable services, clear APIs, reliable data systems, and production ownership - with a product mission that supports teachers, students, and school districts through better digital learning infrastructure.

In my current work as a Product Engineer at Grey Cross Developments, I own backend domains end to end: architecture, API design, implementation, deployment, debugging, and iteration. I have built REST APIs, asynchronous/event-driven pipelines, data ingestion workflows, Redis-backed services, and integrations with external systems. That experience maps closely to Kiddom's need for backend services and databases that are scalable, secure, performant, and maintainable.

Two recent projects are especially relevant. In ForgeGraph, I built backend workflows for data collection, content analysis, report generation, approval gates, and durable company state, with a strong focus on provenance, predictable automation, and production-safe AI features. In my automated trading bot project, I built a real-time WebSocket ingestion pipeline, Redis-backed low-latency data access, Celery-based background execution, and isolated computation services. Together, these projects reflect the same engineering patterns required for a growing platform: asynchronous processing, service boundaries, reliability, observability, and careful handling of data-intensive workflows.

I also bring customer-aware ownership. My work with Vittahouse required translating non-technical operational needs into maintainable automation, troubleshooting production data issues with stakeholders, and communicating tradeoffs clearly. Kiddom's emphasis on working with customers during onboarding and issue resolution is a strong fit for how I already approach backend engineering: systems should not only be technically sound, but understandable, supportable, and useful to the people depending on them.

My academic foundation in Law is complemented by hands-on backend/product engineering since 2019, the Meta Back-End Developer Professional Certificate, IBM RAG and Agentic AI Professional Certificate, and Cambridge English C2 Proficiency. I would be glad to bring that combination of backend ownership, structured problem-solving, and product empathy to Kiddom's engineering team.

Thank you for your consideration. I would welcome the chance to discuss how my Python/backend, data systems, and production-ownership experience can help Kiddom build the next generation of scalable services for digital learning.

Sincerely,
Miguel Athie
